

CPS Downhole Screens

Product #34-8 Patents Granted

Description - Application

Utilizing existing perforated screen technologies we have developed and patented a corrugated downhole screen that can provide up to 4 X's the open area of a similar O.D. plain perforated screen. Unlike conventional perforated screens, the corrugations allow for a multitude of options be it to wire wrap, to mesh wrap, to steel wool wrap, etc. They can also be designed for stator contact for constant de-scaling with PCP pump applications.

For rod pump applications, due to the size of the production pipes it is critical to get as much inflow as possible, while protecting the seals on of the pump from inclusions. No other screen technology, excepting for our TBS products, can offer the open area inflow of our patented corrugated perforated screen technology.

Features/Benefits

- Patented wound wire technology allows for uninterrupted flow and reduced blockage.
- Easily engineered for any application, oil, gas or even water.
